

Session 1:-

Introduction to SaaS and CRM

1. What is SaaS?

SaaS stands for Software as a Service is a cloud based software delivery model where applications are hosted by a service providers and accessed over the internet.

Key characteristics

- No local installation
- accessible via browser

benefits of SaaS

- lower upfront cost
- easy accessibility
- Support remote work

examples

- sales force - CRM
- Hubspot CRM - CRM & marketing
- Zoho CRM - Business CRM
- Microsoft Dynamics 365 - enterprise CRM & ERP

2. What is CRM?
CRM stands for Customer relationship management. It is software that helps business manage customer interaction, sales process & customer data efficiency.

* Why CRM is important?

- centralized customer information
- improved sales tracking
- Better customer service
- data driven decision making

* How Business use CRM?

- Track leads & customers
- manage Salesman Pipelines
- Monitor Customer Communication
- Automate emails and follow up

* Key CRM features

<u>Feature</u>	<u>Description</u>
Contacts	stores customer details
Deals	tracks potential sales
Pipelines	visual Sales stages
Automation	Automated emails, tasks
reports	Sales & performance analysis

Practical Demonstration

* show how a CRM function as a cloud-based SaaS application.

A CRM functions as a cloud based SaaS applications by being hosted on cloud servers & accessed

through the internet using a web browser. Multiple organizations use the same CRM platform through a multi-tenant architecture, where data is securely isolated. The service provider manages infrastructure, updates, security & scalability, allowing users to focus only on managing customer relationships without worrying about software installation or maintenance.

* What is Multi-tenancy

A single instance of the software serves multiple customers (tenants) while keeping their data separate & secure.

* Benefits of Multi-Tenancy:-

- Reduced cost
- efficient Resource usage
- easy updates
- scalability

Real-time example of SaaS

example: Google Docs

Reasons (1) we don't install it on our computer

Page No.
Date:

(ii) we access it through a web browser.

(iii) Google hosts and maintains the software.

(iv) updates happen automatically.

(v) Multiple users work at same time.

Real time Scenario:-

imagine a college project team:-

(i) one student writes the report.

(ii) Another student edit it.

(iii) The guide reviews & comment.

(iv) All are in different locations, works on the same document simultaneously in real time. This is a software as a Services (SaaS) in action.
